## Greedy Algorithm

- Class of algorithms whose choices are locally best.
- Choices are greedy: “live for today” motto.
- Often very simple and efficient algorithms, but not always possible for all problems.
- Example: Coin Changing
  - 4 types of coins: (25, 10, 5, 1)
  - Given integer  $x$  between 9 and 99, make change for  $x$  with least number of coins.

2

1/10/2003

## Greedy Algorithms

- Mathematically, write  $x = 25a + 10b + 5c + 1d$  so that  $a + b + c + d$  is minimum and  $a, b, c, d \geq 0$  are integers.
- Suggest an algorithm for the coin changing problem.

3

1/10/2003

## Greedy Coin Changing

- Choose as many quarters as possible.
- That is, find largest  $a$  so that  $25a \leq x$ .
- Next, choose as many dimes as possible to change  $x - 25a$ , and so on.

4

1/10/2003

## Greedy Coin Changing

- An Example. Consider  $x = 73$ 
  - Choose 2 quarters, so  $a = 2$ .
  - Left  $73 - 2 \times 25 = 23$
  - Next Choose 2 dimes, so  $b = 2$ . Left  $23 - 2 \times 10 = 3$ .
  - Choose 0 nickels, so  $c = 0$ . Left 3
  - Finally, choose 3 pennies, so  $d = 3$ . Left  $3 - 3 = 0$ .
  - Solution  $a = 2, b = 2, c = 0, d = 3$ .

## When Greedy Fails

- Greedy algorithms correctness depends on the choice of coins.
- When coins have denominations (25, 10, 5, 1), the greedy always works for any  $x$ .
- But consider the case when coins are of types (12, 5, 1)
- The greedy does not always return the optimal solution.

6

1/10/2003

## When Greedy Fails

- For  $x = 15$ , the greedy will use 4 coins:  $1 \times 12 + 0 \times 5 + 3 \times 1$ .
- The optimal uses 3 coins:  $3 \times 5$
- Moral: Greed, the quick path to success or to ruin!.

7

1/10/2003

## Related Problems

- Frobenius Problem: Given coins of denomination  $d_1, d_2, \dots, d_n$ , so that no two have a common factor, find the smallest integer  $x$  that cannot be changed using these coins.
- Frobenius problem is NP- Hard!.

## Activity Selection

- Scheduling a resource among competing activities; e.g. processor and jobs, a lecture hall and academic activities etc.
- When an activity is scheduled, it must be run to completion; no pre-emption.
- Let  $S = \{1, 2, \dots, n\}$  be a set of activities that demand the use of a lecture hall.

9

1/10/2003

## Activity Selection

- The activity  $i$  has a start time  $s_i$  and a finish time  $f_i$ . Obviously,  $s_i \leq f_i$ . The hall can be used by at most one activity at any time moment.
- We want to schedule as many activities as possible, subject to single use constraint.
- Suggest an algorithm to solve this problem.

10

1/10/2003

## Activity Selection

- Example: Given the starting time  $s_i$  and finish time  $f_i$  of each activity, where  $0 \leq s_i < f_i < \infty$ :

$i$	1	2	3	4	5	6	7	8	9	10	11
$s_i$	1	3	0	5	3	5	6	8	8	2	12
$f_i$	4	5	6	7	8	9	10	11	12	13	14

11

1/10/2003

## Activity Selection

- Consider the example of 11 activities, shown below.

12

1/10/2003

## Greedy Selection Algorithm

- Sort the activities in increasing finish time order. Takes  $O(n \log n)$  time.
- So, assume that  $f_1 \leq f_2 \leq \dots \leq f_n$ .
- Scan the activities in this order and choose the first one that doesn't conflict with already chosen activities. Repeat, until we reach the end of the activity list.

1/10/2003

## Greedy Selection Algorithm

```

GREEDY-ACTIVITY-SELECTOR( $s, f$ )
1  $n \leftarrow \text{length}[s]$ 
2  $A \leftarrow \{a_1\}$ 
3  $i \leftarrow 1$ 
4 for  $m \leftarrow 2$  to  $n$ 
5   do if  $s_m \geq f_i$ 
6     then  $A \leftarrow A \cup \{a_m\}$ 
7      $i \leftarrow m$ 
8 return  $A$ 
    
```

14

1/10/2003

## Example

- The greedy algorithm first chooses 1; then skips 2 and 3; next it chooses 4, and skips 5, 6, 7; so on.
